Confusion Matrix

ANOMALY DETECTION FOR AFIB

Higher Heart Rate

“inadequate sleep can raise the likelihood of AFib episodes by up to 18%” – Michigan Medicine

“people may be more prone to experiencing AFib symptoms at night, including heart palpitations, a fast heartbeat.” – Medical News Today

ANOMALY DETECTION WITH AI ALGORITHM

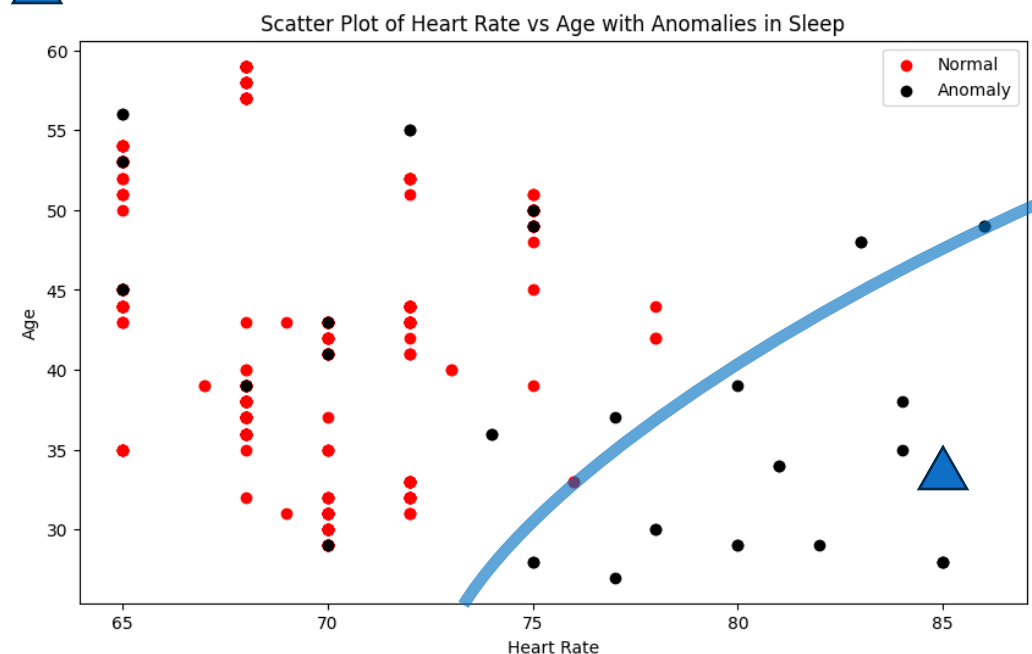

Unsupervised Iso Forest Algorithm using Boundary Lines to Separate Normality's from Anomalies

Ex 1: Sarah - 34 Years Old, Sleeping Heart Rate of 85 BPM ▲

NHT tells user that Sarah has a high heart rate for her age which could put her at risk for A-FIB

Makes Sense since Average heartbeat of Adult during Sleep is 40 – 60 BPM in the U.S.

ANOMALY DETECTION WITH AI ALGORITHM

Unsupervised Iso Forest Algorithm using Boundary Lines to Separate Normality's from Anomalies

Ex 2: Jose - 7 hours Sleep Duration, 83 BPM 

NHT tells user that
Sleep is most
likely not the
underlying cause
of A-FIB Symptom

Background: Americans on average sleeps 6.5 hours Daily

MORE AI INTEGRATION WITH NHT

Unsupervised ML Algorithm Predictor Insights give Mild Warning Notification because of relationship between 2 variables and comparison to general data (Use of Unlabeled Data)

Clustering & Boundary Detection of Users Data signals the instance of Mild Warning on a Weekly basis

Supervised ML Algorithm Predictor Insights give Severe Warning Notification because of Prediction (Use of Labeled Data)

Gradient Booster predicts the presence of Sleep Disorder based on inputs running 5 folds. As accuracy builds between inputs and Sleep Disorder a Severe Warning will be sent out

PERSONALIZED HEALTH PLANS

Weekly Health Plans based on Warnings Received

Ex:

Sleep Warnings	Hours of Sleep to Add
No Warnings	0
Only Severe Warning	2
Only Mild Warning	1
Both Mild Warning & Severe Warning	4

CLOSING PITCHES

- Keeps you Healthy in the Long Term,
Detect it Early
- Cloud & AI integration helps
Company, User, & World
- Need Funding for Scaling Larger Data,
which would provide more insight
